World Bank (for cross Refernece)

<https://data.worldbank.org/indicator/FP.CPI.TOTL.ZG?locations=IN>

2. Inflation

- World Banks (for reference and missing data)

<https://data.worldbank.org/indicator/FP.CPI.TOTL.ZG?end=2023&locations=IN&start=1960&view=chart>

RBI- (Primary data)

<https://data.rbi.org.in/BOE/OpenDocument/2409211437/OpenDocument/opendoc/openDocument.jsp?logonSuccessful=true&shareId=1>

3. Interest Rates-

- World Bank- (cross reference and missing data)

<https://data.worldbank.org/indicator/NY.GDP.MKTP.KD.ZG?end=2023&locations=IN&start=1961>

- RBI- (primary data)

<https://data.rbi.org.in/BOE/OpenDocument/2409211437/OpenDocument/opendoc/openDocument.jsp?logonSuccessful=true&shareId=9>

- Capital mind- (solely for missing data)

4. Unemployment Rate-

- Ministry of Labour and Employment, India: (primary/base data)
 - Website: <https://labour.gov.in/>
 - Look for reports like the Periodic Labour Force Survey (PLFS) and Employment-Unemployment Surveys (EUS).
- National Statistical Office (NSO): (primary/base data)
 - Website: <https://mospi.gov.in/>
 - Provides historical data on employment and unemployment.
- World Bank: (for cross reference and missing data)
 - Website: <https://data.worldbank.org/>
 - Search for "India unemployment rate" to find historical data.
- International Labour Organization (ILO): (for cross reference and missing data)
 - Website: <https://www.ilo.org/>
 - Provides global and country-specific labor statistics.
- Reserve Bank of India (RBI): (Primary)
 - Website: <https://www.rbi.org.in/>
 - Look for annual reports and statistical tables.

Statista:

- Website: <https://www.statista.com/>
- Offers historical and current unemployment statistics

5. Wage:

- Jstor- From 1960-1983

<https://www.jstor.org/stable/4393994>

- DataGov

<https://www.data.gov.in/resource/year-wise-details-nominal-wage-levels-2019-2021>

- Ministry of Labour and employment (primary data source)

<https://labour.gov.in/wages-and-statistics>

- LFPR Data set- World Bank

<https://data.worldbank.org/indicator/SL.TLF.CACT.ZS?locations=IN>

precautions taken

In the process of compiling and analyzing the wage data for India, a significant gap was identified between **1984 and 2016**, where no direct government-reported wage data could be found. Despite extensive research using multiple sources—including **JSTOR, DataGov, the Labour Ministry, MoSPI reports, and Economic Surveys**—no comprehensive dataset covering this period was available.

Officially, the Periodic Labour Force Survey (PLFS), which is the primary source for labour force participation rate (LFPR) data in India, was launched in 2017. This means that consistent, directly comparable LFPR data in the PLFS format is only available from 2017 onward. This caused me to use World bank data from 1990 with no cross reference. However to avoid conflict and get accurate non biased analysis we are going to look over at both the data sets.

During my research, I encountered significant gaps in India's historical interest rate data, especially in the years 1968-1974 and other scattered periods where no official records were available from RBI, MoSPI, or other reliable government agencies. To ensure accuracy and maintain data integrity, I used a systematic and data-driven approach to estimate the missing values.

Methodology Used

1. Cross-Referencing Available Data

- I first compiled all known interest rate values from RBI, World Bank, and archived economic reports.
- Where historical trends were missing, I examined macroeconomic indicators such as inflation, GDP growth, and monetary policy shifts to understand how interest rates evolved.

2. Pattern Recognition & Statistical Interpolation

- I identified patterns in the available data, noting that interest rates tend to follow inflation and economic growth trends.
- I used linear interpolation to estimate missing values between known points, ensuring smooth, realistic transitions in the dataset.

3. Validating the Estimates

- After interpolation, I cross-verified the estimates by comparing them with historical financial events (e.g., banking reforms, inflation surges, and monetary policy changes).
- The generated values were aligned with documented economic shifts, ensuring their real-world accuracy.

4. Final Adjustments

- In cases where estimated values deviated significantly from expected trends, I adjusted them based on historical economic reports and policy decisions.
- This minimized statistical anomalies and improved the reliability of the dataset.

While these interpolated interest rates are not official figures, they are statistically and economically sound. By leveraging government data, macroeconomic indicators, and interpolation techniques, I ensured that the estimated values closely reflect historical economic conditions, making them highly reliable for analysis.

Due to data limitations in unemployment data, I employed a trend-based estimation model aligned with India's economic history. A base trend was established, with adjustments for key economic events impacting unemployment, such as the 1965 Indo-Pak War, 1973 Oil Crisis, 1991 Economic Liberalization, 2008 Financial Crisis, 2016 Demonetization, and 2020 COVID-19 Pandemic. Post-2020, a gradual recovery factor was applied. This method ensures logical consistency, maintaining realistic upper and lower bounds while preventing excessive deviation from available official data.
